## Chemistry: Quantitative Relationships in Chemical Equations

When we balance a chemical equation, we are satisfying the law of conservation of mass; that is, we are making sure that there are the same number of atoms of each element on both sides of the equation. The coefficients we place in front of the substances in an equation are very important because they tell us the mole ratio of the substances in that reaction. For instance, the balanced equation...

$$
\begin{gathered}
\text { hydrogen gas + oxygen gas } \rightarrow \text { liquid water } \\
\qquad 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})
\end{gathered}
$$

can be thought of in terms of...

$$
2 \text { moles } \mathrm{H}_{2}(\mathrm{~g})+1 \text { mole } \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \text { moles } \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$
