$\qquad$
-- involves finding amts. of reactants \& products in a reaction

What can we do with stoichiometry?

For generic equation: $\quad R_{A}+R_{B} \rightarrow P_{1}+P_{2}$

| Given the... | ...one can find the $\ldots$ |
| :---: | :---: |
| amount of $\mathbf{R}_{A}$ (or $\mathbf{R}_{B}$ ) | amount of $\mathbf{R}_{B}$ (or $\mathbf{R}_{A}$ ) that is <br> needed to react with it |
| amount of $\mathbf{R}_{A}$ or $\mathbf{R}_{B}$ | amount of $\mathbf{P}_{1}$ or $\mathbf{P}_{2}$ that will be <br> produced |
| amount of $\mathbf{P}_{1}$ or $\mathbf{P}_{2}$ you need to <br> produce | amount of $\mathbf{R}_{A}$ and/or $\mathbf{R}_{B}$ you <br> must use |

Governing Equation: 2 patties +3 bread $\rightarrow 1 \mathrm{Big} \mathrm{Mac®}$

$$
\begin{aligned}
& 4 \text { patties }+? \\
& \text { excess }+18 \text { bread } \rightarrow ?
\end{aligned}
$$

$$
? \quad+\quad ? \quad \rightarrow \quad 25 \text { Big Macs } ®
$$

## Stoichiometry Island Diagram

EX.
$\ldots \mathrm{TiO}_{2}+\ldots \mathrm{Cl}_{2}+\ldots \mathrm{C} \rightarrow$ _ $\mathrm{TiCl}_{4}+\ldots \mathrm{CO}_{2}+\ldots \mathrm{CO}$

How many mol chlorine will react with 4.55 mol carbon?

What mass titanium (IV) oxide will react with 4.55 mol carbon?

How many molecules titanium (IV) chloride can be made from 115 g titanium (IV) oxide?

## Island Diagram helpful reminders:

1. Use coefficients from the equation only when crossing the middle bridge. The other six bridges always have " 1 mol" before a substance's formula.
2. The middle bridge conversion factor is the only one that has two different substances in it. The conversion factors for the other six bridges have the same substance in both the numerator and denominator.
3. The units on the islands at each end of the bridge being crossed appear in the conversion factor for that bridge.

EX.

$$
2 \mathrm{Ir}+\mathrm{Ni}_{3} \mathrm{P}_{2} \rightarrow 3 \mathrm{Ni}+2 \mathrm{IrP}
$$

If $5.33 \times 10^{28}$ m'cules nickel (II) phosphide react ${ }^{\mathrm{w}} / \mathrm{excess}$ iridium, what mass iridium (III) phosphide is produced?

How many grams iridium will react with 465 grams nickel (II) phosphide?

How many moles of nickel are produced if $8.7 \times 10^{25}$ atoms of iridium are consumed?

EX. What volume hydrogen gas is liberated (at STP) if 50 g zinc react ${ }^{\mathrm{w}}$ /excess hydrochloric acid (HCl)?

EX. At STP, how many m'cules oxygen react ${ }^{w} / 632 \mathrm{dm}^{3}$ butane $\left(\mathrm{C}_{4} \mathrm{H}_{10}\right)$ ?

How many kJ of energy are released when 54 g methane are burned?

At STP, what volume oxygen is consumed in producing 5430 kJ of energy?

What mass of water is made if $10,540 \mathrm{~kJ}$ are released?

## The Limiting Reactant

A balanced equation for making a Big Mac® might be: $\quad 3 B+2 M+E E \rightarrow B_{3} M_{2} E E$

| With... | $\ldots$ and... | $\ldots$ one can make... |
| :---: | :---: | :---: |
| 30 M | excess B and excess EE |  |
| 30 B | excess M and excess EE |  |
| 30 M | 30 B and excess EE |  |

A balanced equation for making a tricycle might be: $\quad 3 \mathrm{~W}+2 \mathrm{P}+\mathrm{S}+\mathrm{H}+\mathrm{F} \rightarrow \mathrm{W}_{3} \mathrm{P}_{2} \mathrm{SHF}$

| With... | ...and... | $\ldots$ one can make... |
| :---: | :---: | :---: |
| 50 P | excess of all other reactants |  |
| 50 S | excess of all other reactants |  |
| 50 P | 50 S and excess of all other reactants |  |

Solid aluminum reacts w/chlorine gas to yield solid aluminum chloride. $2 \mathrm{Al}(\mathrm{s})+3 \mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow \mathbf{2} \mathrm{AlCl}_{3}(\mathrm{~s})$ If 125 g aluminum react ${ }^{\mathrm{w}} /$ excess chlorine, how many g aluminum chloride are made?

If 125 g chlorine react $\mathrm{w} /$ excess aluminum, how many g aluminum chloride are made?

If 125 g aluminum react $\mathrm{w} / 125 \mathrm{~g}$ chlorine, how many g aluminum chloride are made?
limiting reactant (LR): the reactant that runs out first.

Any reactant you don't run out of is an excess reactant (ER).

| From Examples <br> Above... | Limiting Reactant | Excess Reactant(s) |
| :---: | :--- | :--- |
| Big Macs |  |  |
| tricycles |  |  |
| $\mathrm{Al} / \mathrm{Cl}_{2} / \mathrm{AlCl}_{3}$ |  |  |

## How to Find the Limiting Reactant

For the generic reaction $\quad R_{A}+R_{B} \rightarrow P$, assume that the amounts of $R_{A}$ and $R_{B}$ are given. Should you use $R_{A}$ or $R_{B}$ in your calculations?

1. Calc. \# of mol of $R_{A}$ and $R_{B}$ you have.
2. Divide by the respective coefficients in balanced equation.
3. Reactant having the smaller result is the LR.

$$
\text { EX. } \begin{gathered}
2 \mathrm{Fe}(\mathrm{~s}) \\
223 \mathrm{~g} \mathrm{Fe}
\end{gathered}+\begin{gathered}
3 \mathrm{Cl}_{2}(\mathrm{~g}) \\
179 \mathrm{LCl}_{2}
\end{gathered} \rightarrow 2 \mathrm{FeCl}_{3}(\mathrm{~s})
$$

Which is the limiting reactant: Fe or $\mathrm{Cl}_{2}$ ?

How many $\mathrm{g} \mathrm{FeCl}_{3}$ are produced?

EX.
$2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
$13 \mathrm{~g} \mathrm{H}_{2} \quad 80 \mathrm{~g} \mathrm{O}_{2}$
Which is LR: $\mathrm{H}_{2}$ or $\mathrm{O}_{2}$ ?

How many $\mathrm{g} \mathrm{H}_{2} \mathrm{O}$ are formed?

How many $\mathrm{g} \mathrm{O}_{2}$ are left over?

How many $\mathrm{g} \mathrm{H}_{2}$ are left over?

$$
\begin{array}{ll}
\text { EX. } & 2 \mathrm{Fe}(\mathrm{~g})+3 \mathrm{Br}_{2}(\mathrm{l}) \rightarrow 2 \mathrm{FeBr}_{3}(\mathrm{~s}) \\
& 181 \mathrm{~g} \mathrm{Fe} 96.5 \mathrm{LBr}_{2}
\end{array}
$$

Find LR.

How many $\mathrm{g} \mathrm{FeBr}_{3}$ are formed?

How many $g$ of the ER are left over?

Percent Yield $\quad$\begin{tabular}{l}
molten <br>
sodium <br>

| aluminum |
| :---: |
| oxide | <br>

solid
\end{tabular}\(\rightarrow \underset{aluminum}{molten}+\underset{\substack{sodium <br>

oxide}}{solid}\)

EX. Find mass of aluminum produced if you start ${ }^{\mathrm{w}} / 575 \mathrm{~g}$ sodium and 357 g aluminum oxide.

This amount of product is the theoretical yield.

Now suppose that we perform this reaction and get only 172 grams of aluminum. Why?
$\%$ yield $=\frac{\text { actual yield }}{\text { theoretical yield }} \times 100$

EX. Find \% yield for previous problem.

EX. Reaction that powers space shuttle is: $\quad 2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathbf{2} \mathrm{H}_{2} \mathrm{O}(\mathrm{g})+572 \mathrm{~kJ}$

From 100 g hydrogen and 640 g oxygen, what amount of energy is possible?

What mass of excess reactant is left over?

EX. On NASA spacecraft, lithium hydroxide "scrubbers" remove toxic $\mathrm{CO}_{2}$ from cabin.

$$
\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{LiOH}(\mathrm{~s}) \rightarrow \mathrm{Li}_{2} \mathrm{CO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

For a seven-day mission, each of four individuals exhales $880 \mathrm{~g} \mathrm{CO}_{2}$ daily. If reaction is $75 \%$ efficient, how many g LiOH should be brought along?

EX. Automobile air bags inflate with nitrogen via the decomposition of sodium azide:

$$
2 \mathrm{NaN}_{3}(\mathrm{~s}) \rightarrow 3 \mathrm{~N}_{2}(\mathrm{~g})+2 \mathrm{Na}(\mathrm{~s})
$$

At STP and a \% yield of $85 \%$, what mass sodium azide is needed to yield 74 L nitrogen?

EX.

$$
\begin{gathered}
\mathrm{B}_{2} \mathrm{H}_{6}+3 \mathrm{O}_{2} \rightarrow \\
10 \mathrm{~g} \quad 30 \mathrm{~g}
\end{gathered}
$$

EX.

Strategy: 1.
2.

$$
\text { EX. } \quad \underset{100 \mathrm{~g}}{\mathrm{ZnS}}+\underset{100 \mathrm{~g}}{\mathrm{O}_{2}} \rightarrow \underset{\mathrm{Xg} \text { (assuming } 81 \% \text { yield) }}{\mathrm{ZnO}}+\mathrm{SO}_{2}
$$

1. 
2. 
3. 

EX.

$$
\begin{aligned}
& \mathrm{Al}+\ldots \mathrm{Fe}_{2} \mathrm{O}_{3} \rightarrow \ldots \ldots \mathrm{Fe}+\ldots \mathrm{Al}_{2} \mathrm{O}_{3} \\
& \mathrm{Xg} \quad \mathrm{Xg} \quad 800 \mathrm{~g} \text { needed }
\end{aligned}
$$
