## Chemistry: Percent Yield

Directions: Solve each of the following problems. Show your work, including proper units, to earn full credit.

1. "Slaked lime," $\mathrm{Ca}(\mathrm{OH})_{2}$, is produced when water reacts with "quick lime," CaO . If you start with 2400 g of quick lime, add excess water, and produce 2060 g of slaked lime, what is the percent yield of the reaction?
2. Some underwater welding is done via the thermite reaction, in which rust $\left(\mathrm{Fe}_{2} \mathrm{O}_{3}\right)$ reacts with aluminum to produce iron and aluminum oxide $\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right)$. In one such reaction, 258 g of aluminum and excess rust produced 464 g of iron. What was the percent yield of the reaction?
3. Use the balanced equation to find out how many liters of sulfur dioxide are actually produced at STP if $1.5 \times 10^{27}$ molecules of zinc sulfide are reacted with excess oxygen and the percent yield is $75 \%$.

$$
2 \mathrm{ZnS}(\mathrm{~s})+3 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{ZnO}(\mathrm{~s})+2 \mathrm{SO}_{2}(\mathrm{~g})
$$

4. The Haber process is the conversion of nitrogen and hydrogen at high pressure into ammonia, as follows:

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

If you must produce 700 g of ammonia, what mass of nitrogen should you use in the reaction, assuming that the percent yield of this reaction is $70 \%$ ?
